### ABSTRACT

In this research paper, a new class of open sets called gg-open sets in topological space are introduced and studied. Also some of their properties have been investigated. We also introduce gg-closure, gg-interior, gg-neighbourhood, gg-limit points and discuss some properties.

**2010 Mathematics Classification:** 54A05, 54A10

**Keywords:** gg-closed sets, gg-open sets, gg-closure, gg-interior, gg-neighbourhood and gg-limit points.

### 1. INTRODUCTION

The regular semi open sets are introduced and investigated by Cameron<sup>2</sup>. Levin<sup>7</sup> and Savithri<sup>11</sup> introduced and studied generalized closed sets and  $r^g$  closed sets respectively. Basavaraj M ittanagi and Govardhana Reddy<sup>1</sup> introduced and studied gg closed sets. We introduce and study gg-open sets, gg-interior, gg-neighbourhood, gg-closure and gg-limit points in topological space. Throughout this paper  $X$  or  $(X, \tau)$  represents a topological space. For a subset  $A$  of a topological space  $(X, \tau)$ ,  $cl(A)$ ,  $int(A)$ ,  $scl(A)$ ,  $\alpha cl(A)$ ,  $spcl(A)$  and  $gcl(A)$  denote the closure of  $A$ , the interior of  $A$ , the semi-closure of  $A$ , the  $\alpha$ -closure of  $A$ , the semi pre closure of  $A$  and the  $g$ -closure of  $A$  in  $X$  respectively.

### 2. PRELIMINARIES

**Definition 2.1:** A subset  $A$  of a topological space  $(X, \tau)$  is called a

1. Regular open set<sup>14</sup> if  $A = \text{int}(\text{cl}(A))$  and regular closed if  $A = \text{cl}(\text{int}(A))$
2. Regular semi open set [2] if there exists a regular open set  $U$  such that  $U \subseteq A \subseteq \text{cl}(U)$
3.  $\theta$  Closed set<sup>18</sup> if  $A = \text{cl}_\theta(A)$ , where  $\text{cl}_\theta(A) = \{x \in X : \text{cl}(U) \cap A \neq \emptyset, U \in \tau \text{ \& } x \in U\}$
4.  $\delta$  Closed set<sup>18</sup> if  $A = \text{cl}_\delta(A)$ , where  $\text{cl}_\delta(A) = \{x \in X : \text{int}(U) \cap A \neq \emptyset, U \in \tau \text{ \& } x \in U\}$
5. Generalized closed set (g-closed)<sup>7</sup> if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
6.  $\theta$ -generalized closed set ( $\theta$ g- closed)<sup>4</sup> if  $\text{cl}\theta(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$
7.  $\delta$ -generalized closed set ( $\delta$ g- closed)<sup>5</sup> if  $\text{cl}\delta(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$
8.  $\omega$ -closed set<sup>13</sup> if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is semi -open in  $(X, \tau)$ .
9. Strongly generalized closed set (g\*-closed) [16] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is g open in  $(X, \tau)$ .
10. \*g $\alpha$  -closed set<sup>19</sup> if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is g $\alpha$  - open in  $(X, \tau)$ .
11. \*\*g $\alpha$  -closed) set<sup>20</sup> if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is \*g $\alpha$  - open in  $(X, \tau)$ .
12. rb-closed set<sup>9</sup> if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is b-open in  $(X, \tau)$ .
13. g# -closed set<sup>17</sup> if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha$ g- open in  $(X, \tau)$ .
14. gr-closed set<sup>12</sup> if  $\text{rcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
15. swg\*-closed set<sup>8</sup> if  $\text{gcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is semi -open in  $(X, \tau)$ .
16.  $\beta$ wg\*-closed set<sup>3</sup> if  $\text{gcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\beta$ -open in  $(X, \tau)$ .
17. rwg-closed set<sup>10</sup> if  $\text{cl}(\text{int}(A)) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular -open in  $(X, \tau)$ .
18.  $\beta$ wg\*\*-closed set<sup>15</sup> if  $\beta$ wg\*  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular-open in  $(X, \tau)$ .
19. r $\wedge$ g-closed set<sup>11</sup> if  $\text{gcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular -open in  $(X, \tau)$ .

The complement of the closed sets mentioned above are their open sets respectively and vice versa.

### 3. gg-CLOSED SETS IN TOPOLOGICAL SPACE

**Definition 3.1 [1]:** A subset  $A$  of a topological space  $(X, \tau)$  is called generalization of generalized closed (gg-closed) set if  $\text{gcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular semi open in  $(X, \tau)$ .

**Results 3.2: [1]**

- i) Every closed (respectively regular-closed,  $\theta$ -closed,  $\delta$ - closed,  $\pi$ - closed, g- closed,  $\theta$ g-closed,  $\delta$ g- closed, g\*- closed,  $\omega$ - closed, g#- closed,  $\beta$ wg\*- closed, \*g $\alpha$ - closed, \*\*g $\alpha$ -closed, rb- closed, swg\*- closed, gr- closed) set is gg- closed set in  $X$ .
- ii) Every gg- closed set is r $\wedge$ g- closed (respectively rwg- closed,  $\beta$ wg\*\*- closed) set in  $X$ .
- iii) The union of two gg-closed sets is gg-closed set in  $X$ .

#### 4. gg-OPEN SETS IN TOPOLOGICAL SPACE

**Definition 4.1:** A subset  $A$  of a topological space  $(X, \tau)$  is called a  $gg$ -open set in  $X$  if  $A^c$  is a  $gg$ -closed set in  $X$ .

The following Theorem is the analogue of Results 3.2

**Theorem 4.2:** For any topological space  $(X, \tau)$  we have the following

- i) Every open (respectively regular-open,  $\theta$ -open,  $\delta$ -open,  $\pi$ -open,  $g$ -open,  $\theta g$ -open,  $\delta g$ -open,  $g^*$ -open,  $\omega$ -open,  $g^\#$ -open,  $\beta wg^*$ -open,  $*g\alpha$ -open,  $**g\alpha$ -open,  $rb$ -open,  $swg^*$ -open,  $gr$ -open) set is  $gg$ -open set in  $X$ .
- ii) Every  $gg$ -open set is  $r^g$ -open (respectively  $rwg$ -open,  $\beta wg^{**}$ -open) set in  $X$ .

**Theorem 4.3** If  $A$  and  $B$  are  $gg$ -open sets in space  $X$  then  $(A \cap B)$  is also a  $gg$ -open set in  $X$ .

Proof: Let  $A$  and  $B$  be  $gg$ -open sets in  $X$ . Then  $A^c$  and  $B^c$  are  $gg$ -closed sets in  $X$ . By Results 3.2  $(A^c \cup B^c)$  is also  $gg$ -closed set in  $X$ . That is  $(A^c \cup B^c)^c = (A \cap B)^c$  is  $gg$ -closed set in  $X$ . Therefore  $(A \cap B)$  is  $gg$ -open set in  $X$ .

**Remark 4.4** The union of  $gg$ -open sets in  $X$  is generally not a  $gg$ -open set in  $X$ .

**Example 4.5** Let  $X = \{p, q, r\}$ ,  $\tau = \{\phi, X, \{p\}, \{q\}, \{p, q\}, \{p, q, r\}\}$ . If  $A = \{q\}$  and  $B = \{r\}$  then  $A$  and  $B$  are  $gg$ -open sets but  $(A \cup B) = \{q, r\}$  is not a  $gg$ -open set in  $X$ .

**Theorem 4.6** A subset  $A$  of a topological space  $X$  is  $gg$ -open iff  $U \subseteq gint(A)$  whenever  $U \subseteq A$  and  $U$  is regular semiopen in  $X$ .

Proof: Suppose  $A$  is  $gg$ -open,  $U \subseteq A$  and  $U$  is regular semiopen. Then  $A^c \subseteq U^c$  and  $U^c$  is also regular semiopen. By the definition of  $gg$ -closed  $gcl(A^c) \subseteq U^c$ . But  $gcl(A^c) = (gint(A))^c = X - gint(A)$ . This implies that  $U \subseteq gint(A)$ .

Conversely: Suppose that  $U \subseteq gint(A)$  whenever  $U \subseteq A$  and  $U$  is regular semiopen in  $X$ . Let  $A^c \subseteq F$  where  $F$  is regular semiopen in  $X$ .  $F^c \subseteq A$  and  $F^c$  is regular semiopen in  $X$ . we know that  $F^c \subseteq gint(A)$  and  $(gint(A))^c \subseteq F$ . Since  $gcl(A^c) = (gint(A))^c$  we have  $gcl(A^c) \subseteq F$ . Thus  $A^c$  is  $gg$ -closed set. That is  $A$  is  $gg$ -open set.

**Theorem 4.7** If  $gint(A) \subseteq B \subseteq A$  and  $A$  is  $gg$ -open set then  $B$  is  $gg$ -open set.

Proof: Let  $gint(A) \subseteq B \subseteq A$  and  $A$  is  $gg$  open set in  $X$ . Let  $F$  be any regular semi open set in  $X$  such that  $F \subseteq B \subseteq A$ . Now by theorem 4.6,  $F \subseteq gint(A)$ . We have  $gint(A) \subseteq B$  then  $A \subseteq gint(B)$  That is  $gint(A) \subseteq gint(B)$ . This implies that  $F \subseteq gint(B)$ . Now by theorem 4.6,  $B$  is  $gg$ -open set.

**Theorem 4.8** If  $A \subseteq X$  is  $gg$ -closed set then  $gcl(A) - A$  is  $gg$ -open set.

Proof: Let  $A$  be  $gg$ -closed set. Let  $F \subseteq gcl(A) - A$ , where  $F$  is regular semiopen in  $X$  and hence  $F = \phi$ . Then  $F \subseteq gint(gcl(A) - A)$  and by Theorem 4.6,  $gcl(A) - A$  is  $gg$ -open set.

**Remark 4.9** If  $gcl(A)-A$  is gg-open set then  $A$  is need not be a gg-closed set in  $X$ .

**Example 4.10** Let  $X = \{p, q, r, s\}$ ,  $\tau = \{\phi, X, \{p\}, \{q\}, \{p, q\}, \{p, q, r\}\}$ .  $A = \{q, r\}$ ,  $gcl(A) - A = \{q, r, s\} - \{q, r\} = \{s\}$  is gg-open set in  $X$  but  $A$  is not gg-closed set.

**Theorem 4.11** Let  $A$  and  $B$  be subsets of a topological space  $(X, \tau)$ . If  $A$  is gg-open and  $gint(B) \subseteq A$  then  $(A \cap B)$  is gg-open.

Proof: Let  $A$  and  $B$  be gg-open in  $X$  and  $gint(B) \subseteq A$ . Now  $gint(B) \subseteq (A \cap B) \subseteq B$  and  $B$  is gg-open set. By Theorem 4.7,  $(A \cap B)$  is gg-open set in  $X$ .

### gg-CLOSURE AND GG-INTERIOR IN TOPOLOGICAL SPACE

**Definition 4.12** For a subset  $A$  of  $(X, \tau)$ , gg-closure of  $A$  is denoted by  $ggcl(A)$  and it is defined as  $ggcl(A) = \bigcap \{G: A \subseteq G, G \subseteq GGC(X)\}$  or intersection of all gg-closed sets containing  $A$ .

**Theorem 4.13** If  $A$  and  $B$  are subsets of space  $(X, \tau)$  then

- i)  $ggcl(X) = X$ ,  $ggcl(\phi) = \phi$
- ii)  $A \subseteq ggcl(A)$
- iii) if  $B$  is any gg-closed set containing  $A$  then  $ggcl(A) \subseteq B$
- iv) If  $A \subseteq B$  then  $ggcl(A) \subseteq ggcl(B)$
- v)  $ggcl(A) = ggcl(ggcl(A))$
- vi)  $ggcl(A \cup B) = (ggcl(A) \cup ggcl(B))$

Proof:

- i) By the definition of gg-closure,  $ggcl(X) = \text{Intersection of all gg-closed sets containing } X = X \cap \text{gg-closed set containing } X = X \cap X = X$ . Therefore  $ggcl(X) = X$ . By the definition of gg-closure,  $ggcl(\phi) = \text{intersection of all gg-closed sets containing } \phi = \phi \cap \text{any gg-closed set containing } \phi = \phi \cap \phi = \phi$ . Therefore  $ggcl(\phi) = \phi$ .
- ii) By the definition of gg-closure of  $A$ , it is obvious that  $A \subseteq ggcl(A)$ .
- iii) Let  $B$  be any gg-closed set containing  $A$ . Since  $ggcl(A)$  is the intersection of all gg-closed set containing  $A$ .  $ggcl(A)$  is contained in every gg-closed set containing  $A$ . Hence in particular  $ggcl(A) \subseteq B$ .
- iv) Let  $A$  and  $B$  be subsets of  $(X, \tau)$  such that  $A \subseteq B$ . By the definition of gg-closure,  $ggcl(B) = \bigcap \{F: B \subseteq F \in GGC(X)\}$ . If  $B \subseteq F \in GGC(X)$  then  $ggcl(B) \subseteq F$ . Since  $A \subseteq B \subseteq F \in GGC(X)$ , we have  $ggcl(A) \subseteq F$ ,  $ggcl(A) \subseteq \bigcap \{F: B \subseteq F \in GGC(X)\} = ggcl(B)$ . Therefore  $ggcl(A) \subseteq ggcl(B)$ .
- v) Let  $A$  be any subset of  $X$ . By the definition of gg-closure,  $ggcl(A) = \bigcap \{F: A \subseteq F \in GGC(X)\}$ . If  $A \subseteq F \in GGC(X)$  then  $ggcl(A) \subseteq F$ . Since  $F$  is a gg-closed set containing  $ggcl(A)$ , by iii)

$ggcl(ggcl(A)) \subseteq F$ . Hence  $ggcl(ggcl(A)) \subseteq \bigcap \{F: A \subseteq F \in ggcl(X)\} = ggC(A)$ . That is  $ggcl(ggcl(A)) = ggcl(A)$ .

vi) Let  $A$  and  $B$  be subsets of  $(X, \tau)$ . Clearly  $A \subseteq (A \cup B)$  and  $B \subseteq (A \cup B)$ . From iv)  $(ggcl(A) \cup ggcl(B)) \subseteq ggcl(A \cup B) \rightarrow (1)$  Now we have to prove that  $ggcl(A \cup B) \subseteq ggcl(A) \cup ggcl(B)$ . Suppose  $x \notin (ggcl(A) \cup ggcl(B))$  then there exists  $gg$ -closed sets  $A_1$  and  $B_1$  such that  $A \subseteq A_1$ ,  $B \subseteq B_1$  and  $x \notin (A_1 \cup B_1)$ . Thus we have  $(A \cup B) \subseteq (A_1 \cup B_1)$  and  $(A_1 \cup B_1)$  is a  $gg$ -closed set by Results 3.2, such that  $x \notin (A_1 \cup B_1)$ . Thus  $x \notin ggcl(A \cup B)$ . Hence  $ggcl(A \cup B) \subseteq (ggcl(A) \cup ggcl(B)) \rightarrow (2)$ .

From (1) and (2) we have  $ggcl(A \cup B) = (ggcl(A) \cup ggcl(B))$ .

**Theorem 4.14** If  $A \subseteq X$  is  $gg$ -closed set then  $ggcl(A) = A$ .

Proof: Let  $A$  be any  $gg$ -closed set in  $X$ . we have  $A \subseteq ggcl(A) \rightarrow (1)$ . By Theorem 4.13,  $ggcl(A) \subseteq A \rightarrow (2)$ . From (1) and (2),  $ggcl(A) = A$ .

**Remark 4.15** If  $ggcl(A) = A$  then  $A$  is need not be a  $gg$ -closed set in  $X$ .

**Example 4.16** Let  $X = \{p, q, r\}$  and  $\tau = \{\phi, X, \{p\}, \{q\}, \{p, q\}, \{p, r\}\}$  be a topology on  $X$ . Then  $GGC(X) = \{\phi, X, \{q\}, \{r\}, \{p, q\}, \{p, r\}, \{q, r\}\}$ . Now  $ggcl(\{p\}) = \{p\}$ . But  $\{p\}$  is not a  $gg$ -closed set in  $X$ .

**Theorem 4.17** If  $A$  and  $B$  are subsets of a topological space  $(X, \tau)$  then  $ggcl(A \cap B) \subseteq ggcl(A) \cap ggcl(B)$ .

Proof: Let  $A \subseteq X$  and  $B \subseteq X$ . We know that  $(A \cap B) \subseteq A$  and  $(A \cap B) \subseteq B$ . Then by Theorem 4.13 we have  $ggcl(A \cap B) \subseteq ggcl(A)$  and  $ggcl(A \cap B) \subseteq ggcl(B)$ .

Therefore  $ggcl(A \cap B) \subseteq ggcl(A) \cap ggcl(B)$ .

**Remark 4.18** In general  $ggcl(A) \cap ggcl(B)$  is need not be a subset of  $ggcl(A \cap B)$ .

**Example 4.19** Let  $X = \{p, q, r\}$  and  $\tau = \{\phi, X, \{p\}, \{q\}, \{p, q\}, \{p, r\}\}$  be a topology on  $X$ . Let  $A = \{p\}$  and  $B = \{r\}$  are subsets of  $X$ . Now  $A \cap B = \phi$ ,  $ggcl(A) = \{p\}$ ,  $ggcl(B) = \{p, r\}$  and  $ggcl(A \cap B) = \phi$  but  $(ggcl(A) \cap ggcl(B))$  is not a subset of  $ggcl(A \cap B)$ .

**Theorem 4.20** If  $A \subseteq X$  then

- i)  $ggcl(A) \subseteq cl(A)$
- ii)  $ggcl(A) \subseteq gc(A)$
- iii)  $r^{\wedge}g-cl(A) \subseteq ggcl(A)$

Proof:

i) Let  $A \subseteq X$ . We have  $cl(A) = \bigcap \{F: A \subseteq F \in C(X)\}$ . Since every closed set is  $gg$ -closed, if  $A \subseteq F \in C(X)$  then  $A \subseteq F \in GGC(X)$ . That is  $ggcl(A) \subseteq F$ . Therefore  $ggcl(A) \subseteq \bigcap \{F: A \subseteq F \in C(X)\} = cl(A)$ . Hence  $ggcl(A) \subseteq cl(A)$ .

ii) The proof is straight forward

iii) The proof is straight forward.

**Theorem 4.21** Let  $A$  be any subset of a topological space  $X$ . Then  $x \in \text{ggcl}(A)$  if and only if  $U \cap A \neq \emptyset$  for every  $\text{gg}$ -open set  $U$  containing  $x$ .

Proof: We prove this theorem by contradiction. Let  $x \in \text{ggcl}(A)$  and suppose there is a  $\text{gg}$ -open set  $U$  in  $X$  such that  $x \in U$  and  $U \cap A = \emptyset$ . Therefore  $A \subseteq U^c$  which is  $\text{gg}$ -closed set in  $X$ . Also  $\text{ggcl}(A) \subseteq \text{ggcl}(U^c) = U^c$ . Then  $x \notin U \Rightarrow x \notin \text{ggcl}(A)$ . This is a contradiction.

Conversely, suppose that  $U \cap A \neq \emptyset$  for any  $\text{gg}$ -open set  $V$  containing  $x$ . To prove  $x \in \text{ggcl}(A)$ . Suppose  $x \notin \text{ggcl}(A)$ , then there exists a  $\text{gg}$ -closed set  $F$  in  $X$  such that  $x \notin F$  and  $A \subseteq F$ . That is  $x \in F^c$  which is  $\text{gg}$ -open set in  $X$ . Since  $A \subseteq F$ ,  $A \cap F^c = \emptyset$ . This is a contradiction. Therefore  $x \in \text{ggcl}(A)$ .

**Definition 4.22** For a subset  $A$  of  $(X, \tau)$ ,  $\text{gg}$ -interior of  $A$  is denoted by  $\text{ggint}(A)$  and it is defined as  $\text{ggint}(A) = \cup \{G : G \subseteq A \text{ and } G \text{ is } \text{gg}\text{-open in } X\} \text{ or } \cup \{G : G \subseteq A \text{ and } G \in \text{GGO}(X)\}$  or  $\text{ggint}(A)$  is the union of all  $\text{gg}$ -open sets contained in  $A$ .

**Theorem 4.23** Let  $A$  and  $B$  be subsets of space  $X$  then

- i)  $\text{ggint}(X) = X$ ,  $\text{ggint}(\emptyset) = \emptyset$
- ii)  $\text{ggint}(A) \subseteq A$
- iii) if  $B$  is any  $\text{gg}$ -open set contained in  $A$  then  $B \subseteq \text{ggint}(A)$
- iv) If  $A \subseteq B$  then  $\text{ggint}(A) \subseteq \text{ggint}(B)$
- v)  $\text{ggint}(A) = \text{ggint}(\text{ggint}(A))$
- vi)  $\text{ggint}(A \cap B) = (\text{ggint}(A) \cap \text{ggint}(B))$ .

Proof:

i) and ii) follows by the definition of  $\text{gg}$ -interior of  $A$ .

iii) Let  $B$  be any  $\text{gg}$ -open set such that  $B \subseteq A$ . Let  $x \in B$ ,  $B$  be  $\text{gg}$ -open set contained in  $A$ ,  $x$  is an interior point of  $A$  that is  $x \in \text{ggint}(A)$ . Hence  $B \subseteq \text{ggint}(A)$ .

Proof of iv), v) and vi) is similar as Theorem 4.12 and definition of  $\text{gg}$ -interior.

**Theorem 4.24** If a subset  $A$  of  $X$  is  $\text{gg}$ -open then  $\text{ggint}(A) = A$

Proof: Let  $A$  be  $\text{gg}$ -open set of  $X$ . we know that  $\text{ggint}(A) \subseteq A \rightarrow (1)$  Also  $A$  is  $\text{gg}$ -open set contained in  $A$  from Theorem 4.23 iii),  $A \subseteq \text{ggint}(A) \rightarrow (2)$ . Hence from (1) and (2)  $\text{ggint}(A) = A$ .

**Theorem 4.25** If  $A$  and  $B$  are subsets of space  $X$  then  $(\text{ggint}(A) \cup \text{ggint}(B)) \subseteq \text{ggint}(A \cup B)$

Proof: We know that  $A \subseteq (A \cup B)$  and  $B \subseteq (A \cup B)$ . We have Theorem 4.22 iv)  $\text{ggint}(A) \subseteq \text{ggint}(A \cup B)$  and  $\text{ggint}(B) \subseteq \text{ggint}(A \cup B)$ . This implies that  $\text{ggint}(A) \cup \text{ggint}(B) \subseteq \text{ggint}(A \cup B)$ .

**Remark 4.26** In general  $\text{ggint}(A \cup B)$  is not a subset of  $(\text{ggint}(A) \cup \text{ggint}(B))$ .

**Example 4.27** Let  $X = \{p, q, r\}$  and  $\tau = \{\phi, X, \{p\}, \{q\}, \{p, q\}, \{p, r\}\}$  be a topology on  $X$ . Let  $A = \{q, r\}$  and  $B = \{p, q\}$  are subsets of  $X$ . Now  $A \cup B = X$ ,  $ggint(A) = \{q, r\}$ ,  $ggint(B) = \{q\}$ ,  $ggint(A \cup B) = X$  and  $(ggint(A) \cup ggint(B)) = \{q, r\}$  but  $ggint(A \cup B)$  is not a subset of  $(ggint(A) \cup ggint(B))$

**Theorem 4.28** If  $A \subseteq X$  then

- i)  $int(A) \subseteq ggint(A)$
- ii)  $gint(A) \subseteq ggint(A)$
- iii)  $ggint(A) \subseteq r^g\text{-}int(A)$

Proof:

- i) Let  $A \subseteq X$ . Let  $x \in int(A) \Rightarrow x \in \cup \{G : G \text{ is open, } G \subseteq A\}$ . Then there exists an open set  $G$  such that  $x \in G \subseteq A$ . Since every open set is  $gg$ -open, we have  $gg$ -open set  $G$  such that  $x \in G \subseteq A$ . This implies that  $x \in \cup \{G : G \text{ is } gg\text{-open, } G \subseteq A\} \Rightarrow x \in ggint(A)$ . Hence  $int(A) \subseteq ggint(A)$ .
- ii) The proof is straight forward
- iii) The proof is straight forward.

### gg-NEIGHBOURHOOD AND GG-LIMIT POINTS IN TOPOLOGICAL SPACE

**Definition 4.29** Let  $(X, \tau)$  be a topological space and  $x \in X$ . A subset  $N$  of  $X$  is said to be  $gg$ -neighbourhood of  $x$  if there exists  $gg$ -open set  $G$  such that  $x \in G \subseteq N$

**Definition 4.30** Let  $(X, \tau)$  be a topological space and  $A$  be a subset of  $X$ , a subset  $N$  of  $X$  is said to be  $gg$ -neighbourhood of  $A$  if there exists  $gg$ -open set  $G$  such that  $A \subseteq G \subseteq N$ .

**Definition 4.31** The collection of all  $gg$ -neighbourhood of  $x \in X$  is called  $gg$ -neighbourhood system at  $x$  and it is denoted by  $gg\text{-}N(x)$

**Theorem 4.32** Every neighbourhood  $N$  of  $x$  belongs to  $X$  is a  $gg$ -neighbourhood of  $x$ .

Proof: Let  $N$  be a neighbourhood of  $x \in X$ . To prove that  $N$  is a  $gg$ -neighbourhood of  $x$ , by the definition of neighbourhood there exists an open set  $G$  such that  $x \in G \subseteq N$ . Hence  $N$  is a  $gg$ -neighbourhood of  $x$ .

**Remark 4.33** In general, a  $gg$ -neighbourhood  $N$  of  $x$  belongs to  $X$  need not be a neighbourhood of  $x$  in  $X$  as seen from the following example.

**Example 4.34** Let  $X = \{p, q, r, s\}$ ,  $\tau = \{\phi, X, \{p\}, \{q\}, \{p, q\}, \{p, q, r\}\}$ . Then  $GGO(X) = \{\phi, X, \{p\}, \{q\}, \{r\}, \{s\}, \{p, q\}, \{q, r\}, \{r, s\}, \{p, q, r\}\}$ . The set  $\{q, r, s\}$  is a  $gg$ -neighbourhood of the point  $s$ . Since the  $gg$ -open set  $\{r, s\}$  is such that  $s \in \{r, s\} \subseteq \{q, r, s\}$ . However the set  $\{q, r, s\}$  is not a neighbourhood of the point  $d$ , since no open set  $G$  exists such that  $r \in G \subseteq \{r, s\}$ .

**Theorem 4.35** If a subset  $N$  of a space  $X$  is  $gg$ -open then  $N$  is a  $gg$ -nbd of each of its points.

Proof: Suppose  $N$  is  $gg$ -open. Let  $x \in N$ . we claim that  $N$  is  $gg$ -nbd of  $X$ . For  $N$  is a  $gg$ -open set such that  $x \in N \subseteq N$ . Since  $x$  is arbitrary point of  $N$ , it follows that  $N$  is a  $gg$ -nbd of each of its points.

**Remark 4.36** The converse of the above theorem is not true in general as seen from the following example.

**Example 4.37** Let  $X = \{p, q, r\}$  with the topology  $\tau = \{\phi, X, \{p\}, \{q\}, \{p, q\}\}$ . Then  $ggO(X) = \{\phi, X, \{p\}, \{q\}, \{r\}, \{p, q\}\}$ . The set  $\{p, r\}$  is a  $gg$ -neighbourhood of each of its points but not a  $gg$ -open set in  $X$ .

**Theorem 4.38** Let  $X$  be a topological space. If  $F$  is a  $gg$ -closed subset of  $X$  and  $x \in F^c$  then prove that there exists a  $gg$ -nbd  $N$  of  $x$  such that  $N \cap F = \phi$

Proof: Let  $F$  be  $gg$ -closed subset of  $X$  and  $x \in F^c$ . Then by Theorem 6.7,  $F^c$  contains a  $gg$ -nbd of each of its points. Hence there exists a  $gg$ -nbd of  $x$  such that  $N \subseteq F^c$ . That is  $N \cap F = \phi$ .

**Theorem 4.39** Let  $X$  be a topological space and for each  $x \in X$ . Let  $gg-N(x)$  be the collection of all  $gg$ -nbds of  $x$ . Then we have the following results.

- i) for all  $x \in X$ ,  $gg-N(x) \neq \phi$
- ii)  $i \in gg-N(x) \Rightarrow x \in N$ ,
- iii)  $N \in gg-N(x)$ ,  $M$  contains  $N \Rightarrow M \in gg-N(x)$
- iv)  $N \in gg-N(x)$ ,  $M \in gg-N(x) \Rightarrow (N \cap M) \in gg-N(x)$
- v)  $N \in gg-N(x) \Rightarrow$  There exists  $M \in gg-N(x)$  such that  $M \subseteq N$  and  $M \in gg-N(y)$  for every  $y \in M$ .

Proof:

- i) Since  $X$  is a  $gg$ -open set, it is a  $gg$ -nbd of every  $x \in X$ . Hence there exists at least one  $gg$ -nbd (namely  $X$ ) for each  $x \in X$ . Let  $gg-N(x)$  be the collection of all  $gg$ -nbds of  $x$ . Hence  $gg-N(x) \neq \phi$ .
- ii) If  $N \in gg-N(x)$  then  $N$  is a  $gg$ -nbd of  $x$ . so by the definition of  $gg$ -nbd,  $x \in N$ .
- iii) Let  $N \in gg-N(x)$ ,  $M$  contains  $N$ . Then there is a  $gg$ -open set  $G$  such that  $x \in G \subseteq N$ . Since  $N \subseteq M$ ,  $x \in G \subseteq M$  and so  $M$  is a  $gg$ -nbd of  $x$ . Hence  $M \in gg-N(x)$ .
- iv) Let  $N \in gg-N(x)$  and  $M \in gg-N(x)$ . Then by the definition of  $gg$ -nbd there exist  $gg$ -open sets  $G_1$  and  $G_2$  such that  $x \in G_1 \subseteq N$  and  $x \in G_2 \subseteq M$ . Hence  $x \in (G_1 \cap G_2) \subseteq (N \cap M)$ . this implies that  $N \cap M$  is a  $gg$ -nbd of  $x$ . Hence  $(N \cap M) \in gg-N(x)$ .
- v) If  $N \in gg-N(x)$  then there exists a  $gg$ -open set  $M$  such that  $x \in M \subseteq N$ . Since  $M$  is a  $gg$ -open set it is a  $gg$ -nbd of each of its points. Therefore  $M \in gg-N(y)$ , for every  $y \in M$ .

**Definition 4.40** Let  $(X, \tau)$  be a topological space and  $A$  be a subset of  $X$ , then a point  $x \in X$  is called a  $gg$ -limit point of  $A$  iff every  $gg$ -neighbourhood of  $x$  contains a point of  $A$  distinct from  $x$  that is  $((N - \{x\}) \cap A) \neq \phi$  for each  $gg$ -neighbourhood  $N$  of  $x$ .

Also equivalently, every gg-open set  $G$  containing  $x$  contains a point of  $A$  which is other than  $x$ .

**Definition 4.41** The set of all gg-limit points of the set  $A$  is called a derived set  $A$  and is denoted by  $ggd(A)$

**Theorem 4.42** Let  $(X, \tau)$  be a topological space. Let  $A$  and  $B$  are any two subsets of  $X$ . If  $A \subset B$  then  $ggd(A) \subset ggd(B)$ .

Proof: Let  $A$  and  $B$  be any two subsets of  $X$  such that  $A \subset B$ . Let  $x \in ggd(A)$  that is  $x$  is a gg-limit point of  $A$ . Let  $G$  be any gg-open set containing  $x$ . since  $x$  is gg-limit point of  $A$ , by the definition,  $G \cap (A - \{x\}) \neq \phi \rightarrow (1)$  since  $A \subset B$  we have  $A - \{x\} \subset B - \{x\}$  and  $G \cap (A - \{x\}) \subset G \cap (B - \{x\}) \Rightarrow G \cap (A - \{x\}) \neq \phi$ . Therefore  $G \cap (A - \{x\}) \neq \phi$  for every gg-open set containing  $x$ . that is  $x$  is a gg-limit point of  $B$  and  $x \in d(B)$ . then  $x \in ggd(A) \Rightarrow x \in ggd(B)$   
 $\therefore ggd(A) \subset ggd(B)$ .

**Theorem 4.43** Let  $(X, \tau)$  be a topological space and  $A$  be any subset of  $X$  then  $A$  is gg-closed set iff  $ggd(A) \subset A$ .

Proof: Suppose  $A$  is gg-closed. To prove that  $ggd(A) \subset A$ . Let  $x \notin A \Rightarrow x \in X - A$  and  $X - A$  is gg-open set containing  $x$  and  $(X - A) \cap A = \phi$  that is  $(X - A) \cap (A - \{x\}) = \phi$ . Therefore there exist gg-open set  $(X - A)$  containing  $x$  such that  $(X - A) \cap (A - \{x\}) = \phi$ . Therefore  $x$  is not a gg-limit point of  $A$  and  $x \notin ggd(A)$  that is  $ggd(A) \subset A$

Conversely: Suppose  $ggd(A) \subset A$ . To prove  $A$  is a gg-closed set that is to prove  $X - A$  is a gg-open. Let  $x \in (X - A) \Rightarrow x \notin A$  and  $x \notin ggd(A)$ . Then there exist an gg open set  $G$  containing  $x$  such that  $G \cap (A - \{x\}) = \phi \Rightarrow G \cap A = \phi \Rightarrow G \subset X - A$ . Therefore  $\forall x \in (X - A)$  there exist a gg-open set  $G$  such that  $x \in G \subset X - A$ .  $\therefore X - A$  is gg-open set and hence  $A$  is gg-closed set.
