### ABSTRACT

The aim of this paper is to introduce  $g_\beta^\wedge$ -continuous map,  $g_\beta^\wedge$ -irresolute map in topological spaces. The inter relationships of these newly introduced functions with various functions are analysed and the dependence links with the other existing functions are discussed. Composition of two  $g_\beta^\wedge$ -continuous functions and composition of two  $g_\beta^\wedge$ -irresolute functions are also studied in this paper.

**Keywords:**  $g_\beta^\wedge$ -continuous map,  $g_\beta^\wedge$ -irresolute map.

### INTRODUCTION

Norman Levine<sup>9</sup> introduced generalized closed sets (briefly  $g$ -closed sets) in topological spaces in 1970. M.K.R.S. Veerakumar has introduced  $g^\wedge$ -closed sets<sup>22</sup> and discussed their properties. Ramya.N and Parvathi.A introduced  $\Psi g^\wedge$ -closed sets<sup>20</sup> in topological spaces in 2011. Using  $\Psi g^\wedge$ -open, M.Arline Jeyamary introduced  $g_\beta^\wedge$ -closed set<sup>2</sup> and the relation between  $g_\beta^\wedge$ -closed set and the other closed sets are analysed. In this paper,  $g_\beta^\wedge$ -continuous map and  $g_\beta^\wedge$ -irresolute map are defined and their properties are investigated.

### PRELIMINARIES

**Definition 2.1 :** A subset  $A$  of a topological space  $(X, \tau)$  is called

1. a pre-open set[13] if  $A \subseteq \text{int}(\text{cl}(A))$  and pre-closed if  $\text{cl}(\text{int} A) \subseteq A$ .

2. a semi-open set [8] if  $A \subseteq \text{cl}(\text{int}(A))$  and a semi-closed set if  $\text{int}(\text{cl}(A)) \subseteq A$ .
  3. An  $\alpha$ -open set[15] if  $A \subseteq \text{int}(\text{cl}(\text{int}(A)))$  and  $\alpha$ -closed set if  $\text{cl}(\text{int}(\text{cl}(A))) \subseteq A$ .
- The complement of pre-open(resp.semi-open,  $\alpha$ -open) sets are called pre-closed(resp.semi-closed,  $\alpha$ -closed) sets.

**Definition 2.2:** A subset  $A$  of a topological space  $(X, \tau)$  is called

1. a generalized closed set (briefly  $g$ -closed ) [9] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
2. a generalized pre-closed set ( $gp$ -closed)[12] if  $\text{pcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
3. a  $\alpha$ -generalized closed set ( $\alpha g$ -closed ) [11] if  $\alpha \text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
4. a generalized semi-preclosed set ( $gsp$ -closed)[5] if  $\text{spcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
5. a  $g_\beta^\wedge$ -closed set [2] if  $\text{spcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\Psi g^\wedge$ -open in  $(X, \tau)$ .
6. a  $g^*s$ -closed set[10] if  $\text{scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $gs$ -open in  $(X, \tau)$ .
7. a  $g^*$ -closed set[21] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g$ -open in  $(X, \tau)$ .
8. a  $(gs)^*$ -closed set[6] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $gs$ -open in  $(X, \tau)$ .
9. a  $g^\#$ -closed set[23] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha g$ -open in  $(X, \tau)$ .
10. a  $g^\#$ -preclosed set( $g^\#p$ -closed)[18] if  $\text{pcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g^\#$ -open in  $(X, \tau)$ .
11. a  $g^\#$ -semiclosed set ( $g^\#s$ -closed)[24] if  $\text{scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha g$ -open in  $(X, \tau)$ .
12. a  $g^\#p^\#$ -closed set [17] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g^\#$ -open in  $(X, \tau)$ .

**Definition 2.3:** A function  $f:(X, \tau) \rightarrow (Y, \sigma)$  is called a

1.  $g$ -continuous[4] if  $f^{-1}(V)$  is a  $g$ -closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .
2.  $\alpha g$ -continuous[7] if  $f^{-1}(V)$  is a  $\alpha g$ -closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .
3.  $gsp$ -continuous[5] if  $f^{-1}(V)$  is a  $gsp$ -closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .
4.  $gp$ -continuous[3] if  $f^{-1}(V)$  is a  $gp$ -closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .
5.  $g^*$ -continuous[21] if  $f^{-1}(V)$  is a  $g^*$ -closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .
6.  $g^*s$ -continuous[19] if  $f^{-1}(V)$  is a  $g^*s$ -closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .
7.  $g^\#s$ -continuous[24] if  $f^{-1}(V)$  is a  $g^\#s$ -closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .
8. semi-continuous[8] if  $f^{-1}(V)$  is a semi-closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .
9. pre-continuous[13] if  $f^{-1}(V)$  is a pre-closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .
10.  $\alpha$ -continuous[14] if  $f^{-1}(V)$  is a  $\alpha$ -closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .
11.  $g^\#p^\#$ -continuous[16] if  $f^{-1}(V)$  is a  $g^\#p^\#$ -closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .
12.  $g^\#p$ -continuous[1] if  $f^{-1}(V)$  is a  $g^\#p$ -closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .

13.  $g^\#$ -continuous[23] if  $f^{-1}(V)$  is a  $g^\#$ -closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .
14.  $(gs)^*$ -continuous[6] if  $f^{-1}(V)$  is a  $(gs)^*$ -closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .

**Definition 2.4:** A topological space  $(X, \tau)$  is called a

1.  $Tg_\beta^\wedge$ -space[2] if every  $g_\beta^\wedge$ -closed set in it is closed.
2.  $\alpha Tg_\beta^\wedge$ -space[2] if every  $g_\beta^\wedge$ -closed set in it is  $\alpha$ -closed.
3.  $sTg_\beta^\wedge$ -space[2] if every  $g_\beta^\wedge$ -closed set in it is semi-closed.
4.  $pTg_\beta^\wedge$ -space[2] if every  $g_\beta^\wedge$ -closed set in it is pre-closed.
5.  $gTg_\beta^\wedge$ -space[2] if every  $g_\beta^\wedge$ -closed set in it is  $g$ -closed.
6.  $\alpha gTg_\beta^\wedge$ -space[2] if every  $g_\beta^\wedge$ -closed set in it is  $\alpha g$ -closed.

### 3. $g_\beta^\wedge$ -CONTINUOUS MAPS AND $g_\beta^\wedge$ -IRRESOLUTE MAPS

**Definition 3.1:** A function  $f : (X, \tau) \rightarrow (Y, \sigma)$  is called  **$g_\beta^\wedge$ -continuous** if  $f^{-1}(V)$  is a  $g_\beta^\wedge$ -closed set of  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ .

**Definition 3.2:** A function  $f : (X, \tau) \rightarrow (Y, \sigma)$  is called  **$g_\beta^\wedge$ -irresolute** if  $f^{-1}(V)$  is a  $g_\beta^\wedge$ -closed set of  $(X, \tau)$  for every  $g_\beta^\wedge$ -closed set  $V$  of  $(Y, \sigma)$ .

**Theorem 3.3:** Every continuous map is  $g_\beta^\wedge$ -continuous but not conversely.

**Proof:** It follows from the fact that every closed set is a  $g_\beta^\wedge$ -closed set.

**Example 3.4:** Let  $X=Y=\{a,b,c\}$ ,  $\tau = \{ \{b,c\}, X, \varphi \}$  and  $\sigma = \{ \{b\}, \{b,c\}, Y, \varphi \}$ . Define  $f:(X,\tau) \rightarrow (Y,\sigma)$  by  $f(a)=a$ ,  $f(b)=c$ ,  $f(c)=b$ . Then  $f^{-1}\{a,c\}=\{a,b\}$  and  $f^{-1}\{a\}=\{a\}$  are  $g_\beta^\wedge$ -closed in  $(X, \tau)$  but  $\{a,b\}$  is not closed in  $(X, \tau)$ . Hence  $f$  is  $g_\beta^\wedge$ -continuous but not continuous.

**Theorem 3.5:** Every  $(gs)^*$ -continuous[resp.  $g^*s$ -continuous,  $g\#s$ -continuous] is  $g_\beta^\wedge$ -continuous but not conversely.

**Proof:** It follows from the fact that every  $(gs)^*$ -closed set[resp.  $g^*s$ -closed,  $g\#s$ -closed] is a  $g_\beta^\wedge$ -closed set.

**Example 3.6:** Let  $X=Y=\{a,b,c\}$ ,  $\tau = \{ \{b\}, \{a,c\}, X, \varphi \}$  and  $\sigma = \{ \{c\}, Y, \varphi \}$ . Define  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a)=c$ ,  $f(b)=a$ ,  $f(c)=b$ . Then  $f^{-1}\{a,b\}=\{b,c\}$  is  $g_\beta^\wedge$ -closed in  $(X, \tau)$  but not  $(gs)^*$ -closed[resp.  $g^*s$ -closed,  $g\#s$ -closed] in  $(X, \tau)$ . Hence  $f$  is  $g_\beta^\wedge$ -continuous but not  $(gs)^*$ -continuous[resp.  $g^*s$ -continuous,  $g\#s$ -continuous]

**Theorem 3.7:** Every  $g_\beta^\wedge$ -continuous is  $gsp$ -continuous but not conversely.

**Proof:** It follows from the fact that every  $g_\beta^\wedge$ -closed set is  $gsp$ -closed.

**Example 3.8:** Let  $X=Y=\{a,b,c\}$ ,  $\tau = \{ \{a\}, X, \varphi \}$  and  $\sigma = \{ \{a,b\}, Y, \varphi \}$ . Define  $f:(X, \tau) \rightarrow (Y, \sigma)$  by  $f(a)=c$ ,  $f(b)=c$ ,  $f(c)=a$ . Then  $f^{-1}\{c\}=\{a,b\}$  is  $gsp$ -closed in  $(X, \tau)$  but not  $g_\beta^\wedge$ -closed in  $(X, \tau)$ . Hence  $f$  is  $gsp$ -continuous but not  $g_\beta^\wedge$ -continuous.

**Theorem 3.9:** Every semi-continuous map is  $g_\beta^\wedge$ -continuous but not conversely.

**Proof:** Since every semi-closed set is  $g_\beta^\wedge$ -closed set, the result follows.

**Example 3.10:** Let  $X=Y=\{a,b,c\}$ ,  $\tau = \{\{a\}, \{b,c\}, X, \varphi\}$  and  $\sigma = \{\{a,c\}, Y, \varphi\}$ . Define  $f:(X,\tau)\rightarrow(Y,\sigma)$  by  $f(a)=b, f(b)=b, f(c)=a$ . Then  $f^{-1}\{b\}=\{a,b\}$  is  $g_\beta^\wedge$ -closed set in  $(X, \tau)$  but not semi-closed in  $(X, \tau)$ . Hence  $f$  is  $g_\beta^\wedge$ -continuous but not semi-continuous.

**Remark 3.11:**  $g_\beta^\wedge$ -continuous is independent from  $g$ -continuous[resp. $g^*$ -continuous,  $g^\#p^\#$ -continuous] which can be seen from the following examples.

**Example 3.12:** Let  $X=Y=\{a,b,c\}$ ,  $\tau = \{\{a,b\}, X, \varphi\}$  and  $\sigma = \{\{b,c\}, Y, \varphi\}$ . Define  $f : (X, \tau)\rightarrow(Y, \sigma)$  be the identity mapping.  $\{a\}$  is closed in  $(Y, \sigma)$ . Then  $f^{-1}\{a\}=\{a\}$  is  $g_\beta^\wedge$ -closed set in  $(X, \tau)$  but not  $g$ -closed[resp. $g^*$ -closed and  $g^\#p^\#$ -closed] in  $(X, \tau)$ . Hence  $f$  is  $g_\beta^\wedge$ -continuous but not  $g$ -continuous[resp. $g^*$ -continuous and  $g^\#p^\#$ -continuous].

**Example 3.13:** Let  $X=Y=\{a,b,c\}$ ,  $\tau = \{\{b\},\{a,b\}, X, \varphi\}$  and  $\sigma = \{\{a,c\}, Y, \varphi\}$ . Define  $f:(X, \tau)\rightarrow(Y, \sigma)$  by  $f(a)=a, f(b)=b, f(c)=b$ .  $\{b\}$  is closed in  $(Y, \sigma)$ . Then  $f^{-1}\{b\}=\{b,c\}$  is  $g$ -closed[resp. $g^*$ -closed and  $g^\#p^\#$ -closed] but not  $g_\beta^\wedge$ -closed in  $(X, \tau)$ . Hence  $f$  is  $g$ -continuous[resp. $g^*$ -continuous and  $g^\#p^\#$ -continuous] but not  $g_\beta^\wedge$ -continuous .

**Remark 3.14:**  $g_\beta^\wedge$ -continuous is independent from  $gp$ -continuous[resp. $g^\#p$ -continuous] which can be seen from the following example.

**Example 3.15:** Let  $X=Y=\{a,b,c\}$ ,  $\tau = \{\{b\},\{c\},\{b,c\},X, \varphi\}$  and  $\sigma = \{\{a,c\}, Y, \varphi\}$ . Define  $f:(X,\tau)\rightarrow(Y,\sigma)$  be the identity mapping.  $\{b\}$  is closed in  $(Y, \sigma)$ . Then  $f^{-1}\{b\}=\{b\}$  is  $g_\beta^\wedge$ -closed set in  $(X, \tau)$  but not  $gp$ -closed[resp.  $g^\#p$ -closed]. Hence  $f$  is  $g_\beta^\wedge$ -continuous but not  $gp$ -continuous[resp.  $g^\#p$ -continuous].

**Example 3.16:** Let  $X=Y=\{a,b,c\}$ ,  $\tau = \{\{c\}, X, \varphi\}$  and  $\sigma = \{\{b,c\}, Y, \varphi\}$ . Define  $f : (X, \tau)\rightarrow(Y, \sigma)$  by  $f(a)=b, f(b)=a, f(c)=a$ .  $\{a\}$  is closed in  $(Y, \sigma)$ . Then  $f^{-1}\{a\}=\{b,c\}$  is  $gp$ -closed[resp.  $g^\#p$ -closed] but not  $g_\beta^\wedge$ -closed in  $(X, \tau)$ . Hence  $f$  is  $gp$ -continuous[resp.  $g^\#p$ -continuous] but not  $g_\beta^\wedge$ -continuous .

**Theorem 3.17:** Every  $g^\#$ -continuous map is  $g_\beta^\wedge$ -continuous but not conversely.

**Proof:** It follows from the fact that every  $g^\#$ -closed set is a  $g_\beta^\wedge$ -closed set.

**Example 3.18:** Let  $X=Y=\{a,b,c\}$ ,  $\tau = \{\{a,b\}, X, \varphi\}$  and  $\sigma = \{\{b,c\}, Y, \varphi\}$ . Define  $f : (X, \tau)\rightarrow(Y, \sigma)$  be the identity mapping. Then  $f^{-1}\{a\}=\{a\}$  is  $g_\beta^\wedge$ -closed in  $(X, \tau)$  but not  $g^\#$ -closed in  $(X, \tau)$ . Hence  $f$  is  $g_\beta^\wedge$ -continuous but not  $g^\#$ -continuous.

**Theorem 3.19:** Composition of two  $g_\beta^\wedge$ -continuous functions need not be a  $g_\beta^\wedge$ -continuous function. This can be shown in the following example.

**Example 3.20:** Let  $X=Y=Z=\{a,b,c\}$ ,  $\tau = \{\{a,b\}, X, \varphi\}$ ,  $\sigma = \{\{b,c\}, Y, \varphi\}$  and  $\eta = \{\{a,c\}, Z, \varphi\}$ . Define  $f : (X, \tau)\rightarrow(Y, \sigma)$  be the identity map. Define  $g : (Y, \sigma)\rightarrow(Z, \eta)$  by  $g(a)=b, g(b)=b,$

$g(c)=a$ . Then  $f$  and  $g$  both are  $g_\beta^\wedge$ -continuous.  $\{b\}$  is closed in  $(X, \tau)$ . But  $(f \circ g)^{-1}\{b\} = g^{-1}[f^{-1}\{b\}] = \{a, b\}$  is not a  $g_\beta^\wedge$ -closed in  $(X, \tau)$ . Hence  $f \circ g$  is not  $g_\beta^\wedge$ -continuous.

**Theorem 3.21:** Every  $g_\beta^\wedge$ -irresolute function is  $g_\beta^\wedge$ -continuous but not conversely.

**Proof:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be  $g_\beta^\wedge$ -irresolute. Let  $V$  be a closed set in  $(Y, \sigma)$ . Since every closed set is  $g_\beta^\wedge$ -closed,  $V$  is  $g_\beta^\wedge$ -closed in  $(Y, \sigma)$ . Since  $f$  is  $g_\beta^\wedge$ -irresolute,  $f^{-1}(V)$  is  $g_\beta^\wedge$ -closed in  $(X, \tau)$ . Hence  $f$  is  $g_\beta^\wedge$ -continuous.

**Example 3.22:** Let  $X=Y=\{a, b, c\}$ ,  $\tau = \{\{c\}, X, \varphi\}$  and  $\sigma = \{\{b, c\}, Y, \varphi\}$ . Define  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a)=a$ ,  $f(b)=c$ ,  $f(c)=b$ . Then  $f^{-1}\{a\} = \{a\}$  is  $g_\beta^\wedge$ -closed in  $(X, \tau)$ . Therefore  $f$  is  $g_\beta^\wedge$ -continuous.  $\{b\}$  is  $g_\beta^\wedge$ -closed in  $(Y, \sigma)$ . But  $f^{-1}\{b\} = \{c\}$  is not  $g_\beta^\wedge$ -closed in  $(X, \tau)$ . Therefore  $f$  is not  $g_\beta^\wedge$ -irresolute. Hence  $f$  is  $g_\beta^\wedge$ -continuous but not  $g_\beta^\wedge$ -irresolute.

**Theorem 3.23:** Every  $g_\beta^\wedge$ -irresolute function is  $gsp$ -continuous but not conversely.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be  $g_\beta^\wedge$ -irresolute. Let  $V$  be a closed set in  $(Y, \sigma)$ . Since every closed set is  $g_\beta^\wedge$ -closed,  $V$  is  $g_\beta^\wedge$ -closed in  $(Y, \sigma)$ . Since  $f$  is  $g_\beta^\wedge$ -irresolute,  $f^{-1}(V)$  is  $g_\beta^\wedge$ -closed in  $(X, \tau)$ . Since every  $g_\beta^\wedge$ -closed set is  $gsp$ -closed,  $f^{-1}(V)$  is  $gsp$ -closed in  $(X, \tau)$ . Hence  $f$  is  $gsp$ -continuous.

**Example 3.24:** Let  $X=Y=\{a, b, c\}$ ,  $\tau = \{\{a\}, \{a, b\}, X, \varphi\}$  and  $\sigma = \{\{a, c\}, Y, \varphi\}$ . Define  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a)=a$ ,  $f(b)=c$ ,  $f(c)=b$ . Then  $f^{-1}\{b\} = \{c\}$  is  $gsp$ -closed in  $(X, \tau)$ . Therefore  $f$  is  $gsp$ -continuous.  $\{a\}$  is  $g_\beta^\wedge$ -closed in  $(Y, \sigma)$ . But  $f^{-1}\{a\} = \{a\}$  is not  $g_\beta^\wedge$ -closed in  $(X, \tau)$ . Therefore  $f$  is not  $g_\beta^\wedge$ -irresolute. Hence  $f$  is  $gsp$ -continuous but not  $g_\beta^\wedge$ -irresolute.

**Theorem 3.25:** Let  $(X, \tau)$ ,  $(Y, \sigma)$  and  $(Z, \eta)$  be any three topological spaces. Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  and  $g : (Y, \sigma) \rightarrow (Z, \eta)$  be any two functions. Then

- (i)  $g \circ f$  is  $g_\beta^\wedge$ -continuous if  $g$  is continuous and  $f$  is  $g_\beta^\wedge$ -continuous.
- (ii)  $g \circ f$  is  $g_\beta^\wedge$ -continuous if  $g$  is  $g_\beta^\wedge$ -continuous and  $f$  is  $g_\beta^\wedge$ -irresolute.
- (iii)  $g \circ f$  is  $g_\beta^\wedge$ -irresolute if  $g$  is  $g_\beta^\wedge$ -irresolute and  $f$  is  $g_\beta^\wedge$ -irresolute.

**Proof:** The proof is obvious from the definitions [3.1] and [3.2].

**Theorem 3.26:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a  $g_\beta^\wedge$ -continuous map. If  $(X, \tau)$ , the domain of  $f$  is an  $Tg_\beta^\wedge$ -space then  $f$  is continuous.

**Proof:** Let  $V$  be a closed set of  $(Y, \sigma)$ . Since  $f$  is  $g_\beta^\wedge$ -continuous,  $f^{-1}(V)$  is a  $g_\beta^\wedge$ -closed set of  $(X, \tau)$ . Since  $(X, \tau)$  is an  $Tg_\beta^\wedge$ -space  $f^{-1}(V)$  is a closed set of  $(X, \tau)$ . Therefore  $f$  is continuous.

**Theorem 3.27:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a  $g_\beta^\wedge$ -continuous map. If  $(X, \tau)$ , the domain of  $f$  is an  $\alpha Tg_\beta^\wedge$ -space then  $f$  is  $\alpha$ -continuous.

**Proof:** Similar to that of the above theorem [ 3.26].

**Theorem 3.28:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a  $g_\beta^\wedge$ -continuous map. If  $(X, \tau)$ , the domain of  $f$  is an  $sTg_\beta^\wedge$ -space then  $f$  is semi-continuous.

**Proof:** Similar to that of the above theorem [3.26].

**Theorem 3.29:** Let  $f:(X, \tau) \rightarrow (Y, \sigma)$  be a  $g_\beta^\wedge$ -continuous map. If  $(X, \tau)$ , the domain of  $f$  is an  $pTg_\beta^\wedge$ -space then  $f$  is pre-continuous.

**Proof:** Similar to that of the above theorem [3.26].

**Theorem 3.30:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a  $g_\beta^\wedge$ -continuous map. If  $(X, \tau)$ , the domain of  $f$  is an  $gTg_\beta^\wedge$ -space then  $f$  is  $g$ -continuous.

**Proof:** Similar to that of the above theorem [3.26].

**Theorem 3.31:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a  $g_\beta^\wedge$ -continuous map. If  $(X, \tau)$ , the domain of  $f$  is an  $\alpha gTg_\beta^\wedge$ -space then  $f$  is  $\alpha g$ -continuous.

**Proof:** Similar to that of the above theorem [3.26]
